Mass Spectrometry (MS) Data

- Paired measurements:
  - intensity (counts) vs m/z (mass-to-charge ratio).
  - intensity vs retention time.
- Additional various metatdata.

Problems

- Vendor-specific, closed file formats.
- Various open-formats, e.g. mzML, mzXML, mz5, CDF, MGF, CSV.
- Spectra libraries/Annotation information in databases, e.g. SQL.
- Multiple R -packages require different file formats and/or data structures.
- Larger experiments don't fit into RAM.

Solution: Spectra[1]

- Common, flexible data structure and interface.
- Supports various file formats by different backends.

Spectra class

- Handles one or multiple MS spectra.
- Implements typical processing functionality.
- Isolation from type of data storage (handled by backend classes)

MsBackend classes

- Isolation from spectra handling and processing.
- Specific class for each type of data storage.

class	source.files	storage	writeable
MsBackendDataFrame[1]	manual	in-memory	yes
MsBackendHdf5Peaks[1]	hdf5	on-disk	yes
MsBackendMzR[1]	mzML, mzXML and CDF	on-disk	no
MsBackendHmdbXml[2]	XML	on-disk	yes
MsBackendRawFileReader[3]	Thermo .raw	on-disk	no

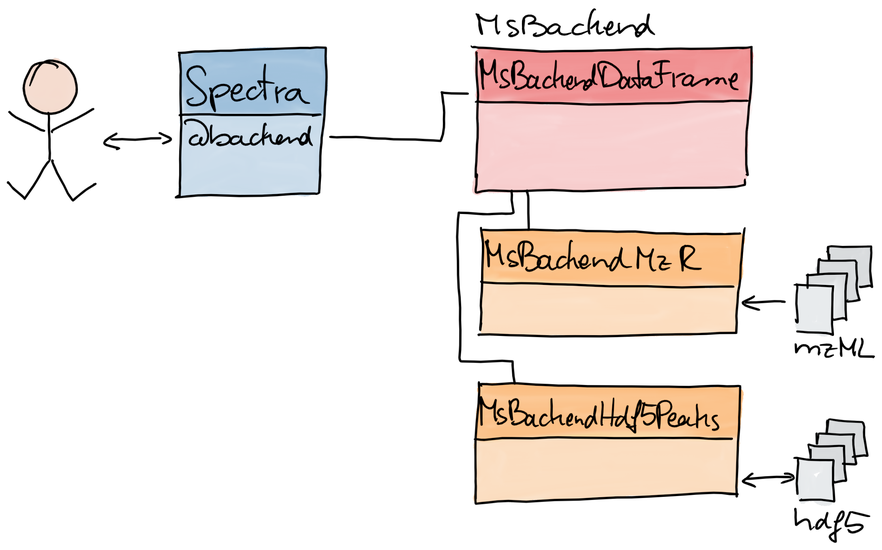

Figure 1: The user interacts with a Spectra object. It takes care of the data storage by different backend classes.

Example

```
# Load packages
library("Spectra")
library("magrittr")

# Import data
#sps <- Spectra("data/20191107_Mix2_CE20.mzML", bac
sps <- Spectra()

# Select all MS2 spectra for a [M+Na]+ ion of
# Fructose.
mzr <- 156.07675 # Histidine
fruct <- sps %>%
    filterMsLevel(2) %>%
    filterPrecursorMz(
        mz = mzr + ppm(c(-mzr, mzr), 20)
    )

# Centroid and clean spectra.
fruct <- fruct %>%
    pickPeaks() %>%
    removePeaks(threshold = 500) %>%
    clean(all = TRUE)

# Change backend: load data in memory.
#fruct <- setBackend(fruct, MsBackendDataFrame())
```

To use the Spectra package install the **R for Mass Spectrometry** packages and load the core packages:

```
BiocManager::install("RforMassSpectrometry/RforMassSpectrometry")
library("RforMassSpectrometry")
```
